Sprint Sentinel — Handover: finish and submit Codegeist 2026

Audience: the teammate who completes the project. No prior Forge knowledge assumed. Deadline: **Tuesday 22 December 2026, 12:00 PM PST** (Devpost). Aim to submit by 18 December. Repository: https://github.com/madhavzanwar/Codegeist (branch `main`).

Contents

0. Where the project stands
1. Repository housekeeping (2 minutes)
2. Accounts you need
3. Install the tools on your computer
4. Get the code and verify it
5. Get an Atlassian site with Jira, Confluence and Rovo
6. Register, deploy and install the app
7. Load the demo data
8. Test everything live (tick each box)
9. Rovo agent — where and what to type
10. MCP tools — connect an external AI client
11. Generate the installation link (for judges)
12. Screenshots for Devpost
13. Marketplace submission (start early; review takes days)
14. Record and upload the demo video
15. Fill in the Devpost form
16. Troubleshooting
17. Prompts for an AI coding assistant (Claude Code, Cursor)
18. Final checklist before pressing Submit
19. Map of the repository
20. Command cheat sheet

0. Where the project stands

Done (in the repository, tested):

- Forge app source: risk engine, Rovo agent, 2 Rovo skills, 10 actions, MCP module, Jira dashboard, Jira issue panel, Confluence page, daily snapshot, Teamwork Graph integration, demo-data seeder.
- Quality gates: lint, typecheck, 88 unit tests (97% line coverage), Forge client-side lint, all clean (`docs/QA.md`).
- Documents: `README.md`, `SUBMISSION.md` (all Devpost text), `docs/DEMO_SCRIPT.md`, `docs/MARKETPLACE.md`, `skills/skill.md`, `CREDITS.md`, `docs/PRIVACY.md`.

Not done (needs a human with an Atlassian login):

1. Register, deploy and install the app on an Atlassian site.
2. Test everything live and fix anything `forge logs` reports.
3. Generate the installation link for judges.
4. Take live screenshots and record the demo video (under 5 minutes, public on YouTube).
5. Submit the Marketplace variant and get the review-ticket link.
6. Fill in and submit the Devpost form.

Time budget: about 1 day of work plus waiting for Marketplace (do step 13 early).

1. Repository housekeeping (2 minutes)

The old branch `claude/youthful-pasteur-fs3z7n` is still the GitHub default branch, so it could not be deleted automatically.

1. Open https://github.com/madhavzanwar/Codegeist/settings (Settings tab of the repository).
2. Under **General → Default branch**, click the switch icon, choose `main`, click **Update**, confirm.
3. Open https://github.com/madhavzanwar/Codegeist/branches and click the trash icon next to `claude/youthful-pasteur-fs3z7n`.
4. Make the repository **Public** (Settings → General → Danger Zone → Change visibility) before submitting, so judges can read the code and `skill.md`.

2. Accounts you need

Account	Where	Notes
Atlassian account	https://id.atlassian.com/signup	Use the same e-mail for everything below.
Atlassian API token	https://id.atlassian.com/manage-profile/security/api-tokens	"Create API token", name it `forge-cli`, copy it once. Never commit it.
Atlassian developer site	created by `forge site provision` (step 5) or https://go.atlassian.com/cloud-dev	Free. Demo sites include Jira, Confluence and Rovo.
GitHub	https://github.com	Access to the repository.
Devpost	https://codegeist2026.devpost.com → **Join hackathon**	Must be registered to submit.
YouTube	https://studio.youtube.com	For the public demo video.
Marketplace partner	https://marketplace.atlassian.com/manage/vendors/create	Only for the Marketplace bonus prize.

3. Install the tools on your computer

Works on macOS, Linux and Windows (use PowerShell or WSL on Windows).

1. Install **Node.js 22 LTS** from https://nodejs.org (check: `node -v` prints v22.x).
2. Install **Git** from https://git-scm.com (check: `git --version`).
3. Install the **Forge CLI**:

```
npm install -g @forge/cli@latest
```

4. Check it:

```
forge --version
```

5. Log in (paste your e-mail, then the API token from section 2 when asked):

```
forge login
```

6. Turn off analytics prompts (optional):

```
forge settings set usage-analytics false
```

4. Get the code and verify it

```
git clone https://github.com/madhavzanwar/Codegeist.git
```

```
cd Codegeist
```

```
npm ci && npm --prefix static/app ci
```

```
npm run check
```

Expected: ESLint prints nothing, typecheck prints nothing, Vitest prints `Tests 88 passed` and a coverage table.

```
npm run forge:lint
```

Expected: `Forge client-side lint: 0 error(s), 0 warning(s).`

5. Get an Atlassian site with Jira, Confluence and Rovo

Recommended (includes Rovo):

```
forge site provision
```

Follow the prompts. Note the site URL it prints, for example `your-name-demo.atlassian.net`. Below this is written as `SITE`.

Alternative: create a site at https://go.atlassian.com/cloud-dev, then add Confluence via https://admin.atlassian.com → Products → Add product. Check Rovo is on: admin.atlassian.com → Rovo (or Apps → AI settings). If Rovo is missing, use `forge site provision`.

6. Register, deploy and install the app

Option A — one command (recommended). macOS/Linux/WSL:

```
SITE=your-site.atlassian.net ./scripts/ship.sh
```

What it does: installs dependencies, runs lint, typecheck, tests and the UI build, runs `forge register` the first time (this writes your new app id into `manifest.yml`), runs `forge lint`, deploys to

production and installs into Jira and Confluence.

Option B — the same, step by step (Windows PowerShell or if the script stops):

```
npm run build:ui
```

```
forge register "Sprint Sentinel" --accept-terms
```

```
forge lint
```

```
forge deploy -e production
```

```
forge install -e production -s your-site.atlassian.net -p Jira
```

```
forge install -e production -s your-site.atlassian.net -p Confluence
```

When `forge install` lists the scopes, accept them (you must be site and organization admin for the Teamwork Graph scopes — you are, on your own site).

Then commit the app id that `forge register` wrote into `manifest.yml`:

```
git add manifest.yml && git commit -m "chore: register Forge app id" && git push
```

Updating later: after any code change run `npm run build:ui && forge deploy -e production`. If you changed scopes in `manifest.yml`, also run `forge install -e production -s SITE -p Jira --upgrade` (and `-p Confluence --upgrade`).

Seeing errors:

```
forge logs -e production --since 15m
```

7. Load the demo data

1. Open `https://SITE/jira` → **Projects** → **Create project** → **Scrum** template → name `Sentinel Demo`, key `SEN` → Create.
2. In the project's left sidebar or top tabs, open **Sprint Sentinel**. (If not visible: Project settings → Apps, or wait 1–2 minutes after deploy and reload.)
3. Click **Load demo sprint data**. A progress bar runs for about one minute and the dashboard appears.
4. Do this at least **2 hours before recording**, then on the dashboard click **Settings** → set **Stale after (hours)** to `1` → **Save & re-analyse**. Stale signals need real elapsed time; the app never fakes timestamps.

Terminal alternative (needs an API token, creates the project for you):

```
JIRA_SITE=https://your-site.atlassian.net JIRA_EMAIL=you@example.com \
  JIRA_API_TOKEN=paste-token npm run seed -- --project SEN --create-project
```

8. Test everything live (tick each box)

☐ **Dashboard** loads: health gauge, score breakdown, riskiest issues, findings tab, assignee load, trend, confidence.

☐ Expand the top issue: evidence shows issue keys, dates and counts.

☐ **Flag** on a risky issue → **Preview** → **Confirm and apply** → open the issue: flag set and a comment ending "posted via Sprint Sentinel after user confirmation".

☐ Repeat with **Label**, **Comment**, **Follow-up sub-task**.

☐ Click **Refresh**: the trend says "Since last run" with a change.

☐ Open issue `SEN-1` (or any issue in the sprint) → **Apps** (or the panel button) → **Sprint risk** shows the same score.

☐ **Publish report** → pick a Confluence space → Preview → Confirm → page opens with summary, tables and trend.

☐ Confluence → **Apps** → **Sprint Sentinel** page shows `SEN`.

☐ Rovo agent works (section 9).

☐ MCP works (section 10).

☐ `forge logs -e production --since 30m` shows no errors.

If something fails, see section 16 (troubleshooting) and the AI-assistant prompts in section 17.

9. Rovo agent — where and what to type

Open it either with the **Ask Sentinel** button on the dashboard, or in Jira/Confluence click **Rovo** (or **Chat**) in the top bar → **Agents** / browse agents → **Sprint Sentinel**.

Prompts to use (in this order for the demo):

1. `Is the SEN sprint on track?`
2. `What are the top 5 delivery risks and the evidence for each?`
3. `Why is SEN-10 risky?` (replace with the top issue key from the dashboard)
4. `Who on the team is overloaded? Include Teamwork Graph context.`
5. `Flag SEN-6 as an impediment and ask the owner for an ETA.` → the agent shows a **preview** and asks to confirm → reply `yes`.
6. `Add the label sentinel-dependency to SEN-1.` → preview → `yes`.
7. `Create a follow-up sub-task to define acceptance criteria for SEN-3.` → preview → `yes`.
8. `Publish a Sprint Risk Report for SEN to the <SPACEKEY> space.` → preview → `yes`.
9. `How has the risk changed since the last run?`

Expected behaviour: every claim cites issue keys/dates; it states a confidence level; it never writes without your "yes". If it writes without a preview, that is a bug — report it with the transcript.

10. MCP tools — connect an external AI client

10.1 Enable exposure (site admin, once):

1. Open https://admin.atlassian.com → select your organization.
2. **Apps** → **Sites** → your site → **Connected apps**.
3. Click **Sprint Sentinel** → open app details → turn on the MCP tools (all 10).

10.2 Find your app id: in `manifest.yml`, `app.id` looks like `ari:cloud:ecosystem::app/1234abcd-.....`. The UUID after `app/` is `APP_ID`. Your MCP URL is:

```
https://mcp.atlassian.com/forge/APP_ID
```

10.3 Connect a client (pick one):

Claude Code (terminal):

```
claude mcp add --transport http sprint-sentinel https://mcp.atlassian.com/forge/APP_ID
```

Claude Desktop / claude.ai: Settings → **Connectors** → **Add custom connector** → name `Sprint Sentinel`, URL as above → Connect → complete the Atlassian consent screen (choose your site, approve).

Cursor: create or edit `~/.cursor/mcp.json`:

```
{ "mcpServers": { "sprint-sentinel": { "url": "https://mcp.atlassian.com/forge/APP_ID" } } }
```

10.4 Give the client the skill: paste the contents of `skills/skill.md` into the project instructions (Claude project knowledge, Cursor rules, or `CLAUDE.md`).

10.5 Prompts to test:

1. `Using the sprint-sentinel tools, list the sprints in project SEN.`
2. `Analyse the SEN sprint and tell me the riskiest issue and why, with evidence.`
3. `Label that issue sentinel-at-risk.` → it must show a preview and wait → reply `yes`.

Also check Rovo Studio: Rovo → **Studio** → Create agent → Tools → the Sprint Sentinel tools are listed.

11. Generate the installation link (for judges)

1. Open https://developer.atlassian.com/console/myapps/ → click **Sprint Sentinel**.
2. Left menu **Distribution** → **Distribution controls** → **Edit**.
3. Choose **Sharing** (not "within organization" — judges are outside your org).
4. Fill app details: name `Sprint Sentinel`, vendor (your name/team), privacy policy URL `https://github.com/madhavzanwar/Codegeist/blob/main/docs/PRIVACY.md`, support URL `https://github.com/madhavzanwar/Codegeist/issues`. Save.
5. Select products **Jira** and **Confluence**.
6. Copy the **Installation link**.
7. Paste it into `SUBMISSION.md` replacing `<PASTE INSTALLATION LINK HERE>`, and replace `<APP_ID>` everywhere (`SUBMISSION.md`, `README.md`, `skills/skill.md`):

```
grep -rn "APP_ID\|PASTE INSTALLATION" --include=*.md .
```

8. Test the link in a private browser window logged into a **second** Atlassian site if you have one.
9. Commit and push:

```
git commit -am "docs: add installation link and app id" && git push
```

Important: do **not** add `licensing` to this app or submit this app to Marketplace — that disables installation links. Marketplace uses a separate registration (section 13).

12. Screenshots for Devpost

Take them on the live site after seeding (browser width about 1440 px, light theme; one dark-mode shot is a plus). Save in `docs/screenshots/live/`. List:

1. Jira dashboard (full).
2. Top issue expanded with evidence.
3. Confirmation modal with the preview.
4. The issue after the action (flag + comment).

5. Issue panel.
6. Rovo chat: analysis answer.
7. Rovo chat: preview → "yes" → done.
8. Published Confluence report.
9. Claude/Cursor using the MCP tools.
10. Assignee load with Teamwork Graph teams.
11. Confluence Sprint Sentinel page.

Tools: macOS Cmd+Shift+4; Windows Win+Shift+S; or the GoFullPage Chrome extension for full pages.

13. Marketplace submission (start early; review takes days)

Follow `docs/MARKETPLACE.md`. Short version:

```
git switch -c marketplace
```

```
forge register "Sprint Sentinel for Jira" --accept-terms
```

Add to `manifest.yml` under `app:` (paid listing, required because the app supports Jira + Confluence):

```
  licensing:
    enabled: true
```

```
npm run build:ui && forge deploy -e production
```

```
git commit -am "chore: Marketplace variant" && git push -u origin marketplace
```

Then:

1. Create a partner profile: https://marketplace.atlassian.com/manage/vendors/create (for paid apps also fill payment/tax details).
2. Create the listing: https://marketplace.atlassian.com/manage/apps/create → Forge app → Sprint Sentinel for Jira → production.
3. Paste listing copy from `docs/MARKETPLACE.md` (name, tagline, summary, highlights, description, keywords). Logo: export `static/app/public/sentinel.svg` to 144×144 PNG (e.g. https://svgtopng.com). Screenshots from section 12.
4. Submit for approval. Copy the review-ticket or listing URL into `SUBMISSION.md` (replace `<PASTE MARKETPLACE REVIEW TICKET / LISTING LINK>`).

14. Record and upload the demo video

1. Read `docs/DEMO_SCRIPT.md` (9 shots, about 3:40). Rehearse once.
2. Before recording: data seeded at least 2 hours earlier, stale threshold 1 h, dashboard opened once earlier (so the trend has a previous run), Confluence space exists, MCP client connected, browser notifications off, bookmarks bar hidden.
3. Record with OBS Studio (https://obsproject.com, free), Loom, or the macOS screen recorder (Cmd+Shift+5). 1080p. Record voice-over live or afterwards. No copyrighted music.
4. Trim (any editor: iMovie, Clipchamp, DaVinci Resolve). Keep it **under 5:00**.
5. Upload at https://studio.youtube.com → **Create** → **Upload videos**.
   - Title: `Sprint Sentinel — explainable delivery risk for Jira (Codegeist 2026)`

- Description: paste the tagline from `SUBMISSION.md`, then the repository URL and "Built with Atlassian Forge, Rovo, MCP and Teamwork Graph."
- Audience: "No, it's not made for kids".
- Visibility: **Public**. Add English subtitles (auto-captions then fix).

6. Copy the YouTube link into `SUBMISSION.md` (replace `<YOUTUBE LINK>`), commit and push.

15. Fill in the Devpost form

Go to https://codegeist2026.devpost.com → **Enter a submission** (or My projects → Edit). Copy each field from `SUBMISSION.md`:

Devpost field	Paste from
Project name	`SUBMISSION.md` → Title (`Sprint Sentinel — explainable delivery risk for Jira, powered by Rovo`)
Elevator pitch / tagline	`SUBMISSION.md` → Tagline
Thumbnail / image gallery	Section 12 screenshots (dashboard first)
About the project (story)	`SUBMISSION.md` → "About the project" (Inspiration … What's next), keep the headings
Built with	`SUBMISSION.md` → Built with (enter as tags)
Try it out links	GitHub repository URL + installation link
Video demo link	YouTube URL
Category	**Apps for Software Teams**
Bonus prizes	Tick **Best Agents**, **Best app with Atlassian MCP**, **Best apps with Teamwork Graph integration**, **Best Marketplace published app**
Installation link / access	Installation link + paste "Judge test instructions" from `SUBMISSION.md`
How it meets the requirement	`SUBMISSION.md` → "How it meets the main technology requirement"
Bonus-prize materials	MCP: link to `skills/skill.md` on GitHub and the MCP URL; Marketplace: review-ticket link; Teamwork Graph: one sentence from the bonus table
Team members	Invite teammates from the project page

Click **Save draft**, re-read everything, then **Submit**. You can edit until the deadline.

16. Troubleshooting

Symptom	Fix
`Not logged in` / `UserNotFoundError`	Run `forge login` again with a fresh API token.
`forge register` asks for a Developer Space	Choose your personal space, or add `--personal`.
Deploy error "resource path does not exist"	Run `npm run build:ui` first (creates `static/app/build`).
Deploy rejects the `rovo:skill` or `rovo:mcp` module	Update the CLI: `npm i -g @forge/cli@latest`; these are Preview modules.
Install fails on Teamwork Graph scopes	You must be **organization admin**. Use your own developer/demo site.
"Sprint Sentinel" tab not visible	Wait 2 minutes after deploy and reload; check Jira → Apps → Manage apps.
Dashboard says "no Scrum board"	Project must use the **Scrum** template (Kanban has no sprints).
Seeder: "already has an active sprint"	Use a new Scrum project; complete the existing sprint first.

Symptom	Fix
Dashboard shows "Teamwork Graph: no data returned"	Admin → Connected apps → Sprint Sentinel → Permissions: enable graph scopes; wait 1 minute. Also needs teams (https://home.atlassian.com → Teams) to show team names.
"Confluence is not reachable" on publish	Install into Confluence: `forge install -e production -s SITE -p Confluence`.
Rovo agent not listed	Rovo must be enabled on the site; reload; agent name is "Sprint Sentinel".
MCP client cannot connect	Exposure not enabled (section 10.1), wrong APP_ID, or the client's OAuth window was blocked by a popup blocker.
Action returns "Arguments changed after the preview"	The agent changed text between preview and confirm; ask again — a new preview is issued.
Any other error	`forge logs -e production --since 30m` and use the prompts in section 17.

17. Prompts for an AI coding assistant (Claude Code, Cursor)

Open the repository in your assistant and paste the prompt that fits.

Fix a runtime error:

```
This is a Forge app (see README.md and docs/RESEARCH.md). Here is the output of `forge
  logs -e production --since 30m`:
<paste logs>
Find the root cause, fix it with the smallest change, add or update a unit test in test/,
  and run `npm run check` and `npm run forge:lint`. Do not change the confirmation-token
  protocol in src/ops.ts.
```

Fix a deploy or lint failure:

```
`forge deploy -e production` (or `forge lint`) failed with:
<paste output>
Read the current Forge docs for the module involved, fix manifest.yml or the code, and
  re-run `npm run forge:lint`. Explain what changed.
```

Polish the UI after looking at it live:

```
Here is a screenshot of the Sprint Sentinel dashboard on a real Jira site: <attach>.
  Improve spacing/alignment issues you see in static/app/src (keep Atlassian design
  tokens, keep light and dark mode), run `npm run typecheck`, `npm run build:ui`, and
  `npm run screenshots`.
```

Tighten the Devpost text:

```
Read SUBMISSION.md and docs/DEMO_SCRIPT.md. Rewrite the "About the project" section to be
  punchier for judges (criteria: technical implementation, design, impact, innovation,
  presentation — 20% each) without inventing features. Keep every claim true to the code.
```

18. Final checklist before pressing Submit

- ☐ `main` is the default branch; old branch deleted; repository public.
- ☐ App deployed to **production** and installed; live checklist (section 8) all ticked.
- ☐ Installation link works and is in `SUBMISSION.md` and on Devpost.
- ☐ `APP_ID` placeholders replaced in `SUBMISSION.md`, `README.md`, `skills/skill.md`.

☐ Video public on YouTube, under 5 minutes, English, link on Devpost.

☐ Marketplace review ticket or listing link on Devpost.

☐ Category = Apps for Software Teams; four bonus prizes ticked.

☐ Screenshots uploaded; README screenshot list updated if desired.

☐ Final `npm run check` passes on `main`; everything pushed.

☐ Submitted before **22 Dec 2026, 12:00 PM PST**.

19. Map of the repository

Path	What it is
`manifest.yml`	Forge modules, scopes, app id
`src/core/`	Pure risk engine (signals, graph, scoring, trend, report, confirmation)
`src/jira/`, `src/confluence/`, `src/twg/`	API access (Jira, Confluence, Teamwork Graph)
`src/service.ts`, `src/ops.ts`	Analysis pipeline; confirmed write operations
`src/actions/`, `src/resolvers/`, `src/index.ts`	Rovo/MCP action handlers, UI resolvers, Forge entry points
`src/seed/`	Demo dataset and seeder
`static/app/`	React Custom UI (dashboard, issue panel, Confluence page)
`skills/sprint-risk-*/SKILL.md`	Rovo skills bundled with the app
`skills/skill.md`	Open-source skill for external MCP clients
`resources/agent/prompt.md`	Rovo agent prompt
`scripts/`	`ship.sh`, `seed-demo.ts`, `forge-lint-offline.cjs`, `screenshots.mjs`, `make-handover-pdf.py`
`test/`	Vitest unit tests
`docs/`	QA, research, demo script, Marketplace guide, privacy, this handover

20. Command cheat sheet

Task	Command
Install dependencies	`npm ci && npm --prefix static/app ci`
All checks	`npm run check`
Forge lint offline / full	`npm run forge:lint` / `forge lint`
Build UI	`npm run build:ui`
Deploy	`forge deploy -e production`
Install / upgrade	`forge install -e production -s SITE -p Jira [--upgrade]`
Logs	`forge logs -e production --since 15m`
Seed from terminal	`JIRA_SITE=… JIRA_EMAIL=… JIRA_API_TOKEN=… npm run seed -- --project SEN --create-project`
UI preview without Jira	`npm --prefix static/app run dev` then open the printed localhost URL
Regenerate screenshots	`npm run screenshots`
Rebuild this PDF	`python3 scripts/make-handover-pdf.py`
